## NeoColab\_REC\_CS23231\_DATA STRUCTURES

### REC\_DS using C\_Week 6\_COD\_Question 4

Attempt : 1  
Total Mark : 10  
Marks Obtained : 10

#### Section 1 : Coding

##### 1. Problem Statement

Kavya, a software developer, is analyzing data trends. She has a list of integers and wants to identify the  $n$ th largest number in the list after sorting the array using QuickSort.

To optimize performance, Kavya is required to use QuickSort to sort the list before finding the  $n$ th largest number.

##### ***Input Format***

The first line of input consists of an integer  $n$ , representing the size of the array.

The second line consists of  $n$  space-separated integers, representing the elements of the array `nums`.

The third line consists of an integer  $k$ , representing the position of the largest

number you need to print after sorting the array.

### **Output Format**

The output prints the k-th largest number in the sorted array (sorted in ascending order).

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 6

-1 0 1 2 -1 -4

3

Output: 0

### **Answer**

```
#include <stdio.h>
```

```
#include <stdlib.h>
```

```
void swap(int* a, int* b) {  
    int temp = *a;  
    *a = *b;  
    *b = temp;  
}
```

```
// Partition function for QuickSort  
int partition(int arr[], int low, int high) {  
    int pivot = arr[high];  
    int i = low - 1;
```

```
    for (int j = low; j < high; j++) {  
        if (arr[j] < pivot) {  
            i++;  
            swap(&arr[i], &arr[j]);  
        }  
    }
```

```
    swap(&arr[i + 1], &arr[high]);  
    return i + 1;  
}
```

```
void quicksort(int arr[], int low, int high) {  
    if (low < high) {  
        int pi = partition(arr, low, high);  
  
        quicksort(arr, low, pi - 1);  
        quicksort(arr, pi + 1, high);  
    }  
}
```

```
void findNthLargest(int* nums, int n, int k) {  
    quicksort(nums, 0, n - 1);  
    printf("%d\n", nums[n - k]);  
}
```

```
int main() {  
    int n, k;  
    scanf("%d", &n);  
    int* nums = (int*)malloc(n * sizeof(int));  
    for (int i = 0; i < n; i++) {  
        scanf("%d", &nums[i]);  
    }  
    scanf("%d", &k);  
    findNthLargest(nums, n, k);  
    free(nums);  
    return 0;  
}
```

**Status :** Correct

**Marks :** 10/10
